Topology Diagram

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
R1	Fa0/0	192.168.1.65	255.255.255.192	N/A
	S0/0/0	192.168.1.129	255.255.255.192	N/A
R2	Fa0/0	192.168.1.193	255.255.255.192	N/A
	S0/0/0	192.168.1.190	255.255.255.192	N/A
PC1	NIC	192.168.1.126	255.255.255.192	192.168.1.65
PC2	NIC	192.168.1.254	255.255.255.192	192.168.1.193

Learning Objectives

Upon completion of this lab, you will be able to:

- Subnet an address space given requirements.
- Assign appropriate addresses to interfaces and document.
- Configure and activate Serial and FastEthernet interfaces.
- Test and verify configurations.
- Reflect upon and document the network implementation.

Scenario

In this lab activity, you will design and apply an IP addressing scheme for the topology shown in the Topology Diagram. You will be given one address block that you must subnet to provide a logical addressing scheme for the network. The routers will then be ready for interface address configuration according to your IP addressing scheme. When the configuration is complete, verify that the network is working properly.

Task 1: Subnet Address Space.

Step 1: Examine the network requirements.

You have been given the 192.168.1.0/24 address space to use in your network design. The network consists of the following segments:

- The network connected to router R1 will require enough IP addresses to support 15 hosts.
- The network connected to router R2 will require enough IP addresses to support 30 hosts
- The link between router R1 and router R2 will require IP addresses at each end of the link.

Step 2: Consider the following questions when creating your network design.

How many subnets are needed for this network?

Ans:- 3 subnets are needed.

- First subnet the network connected to router R1
- Second subnet the link between R1 and R2
- Third subnet the network connected to router R2.

What is the subnet mask for this network in the dotted decimal format?

Ans:- 192.168.1.0/24 belongs to Class C as 192(first octet) comes in the range of class C.

Subnet mask: 255.255.255.0 is the default.

The first three octets are dedicated to the network and don't change.

Since our requirement is of 3 subnets, the subnet mask will be calculated as

$$2^{n}>=3$$

Thus, **n=2**

We use 2 bits for the subnet in the last 8 bits of IP Address and 6 bits as host bits. The binary format is represented as 11111111.111111111111111111111000000

Converting this to dotted decimal format – **255.255.255.192**

What is the subnet mask for the network in slash format?

Ans: It is the total number of 1's in the binary form of the subnet mask. So, the subnet mask for the network in slash format is /26.

How many usable hosts are there per subnet?

Ans: Usable hosts= $2^h - 2 = 2^6 - 2 = 62$

h= number of zero in the binary form of subnet mask = 6
First address of the subnet - network identification. Last address of the subnet - broadcast.

Step 3: Assign sub-network addresses to the Topology Diagram.

- 1. Assign Subnet 1 to the network attached to R1 = 192.168.1.64-198.162.1.127
- 2. Assign subnet 2 to the link between R1 and R2. = 192.168.1.128-198.162.1.191
- 3. Assign subnet 3 to the network attached to R2 = 192.168.1.192-198.162.1.255

Task 2: Determine Interface Addresses.

Step 1: Assign appropriate addresses to the device interfaces.

1. Assign the first valid host address in subnet 1 to the LAN interface on R1.

$$\Rightarrow$$
 Fa0/0 = 192.168.1.65

2. Assign the last valid host address in subnet 1 to PC1.

3. Assign the first valid host address in subnet 2 to the WAN interface on R1.

4. Assign the last valid host address in subnet 2 to the WAN interface on R2.

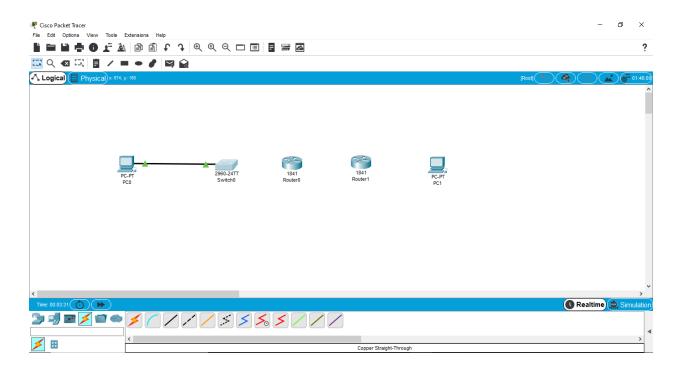

$$\Rightarrow$$
 S0/0/0 = 192.168.1.190

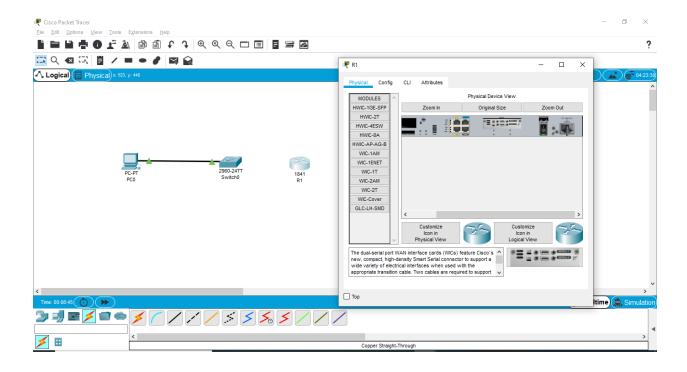

5. Assign the first valid host address in subnet 3 to the LAN interface of R2.

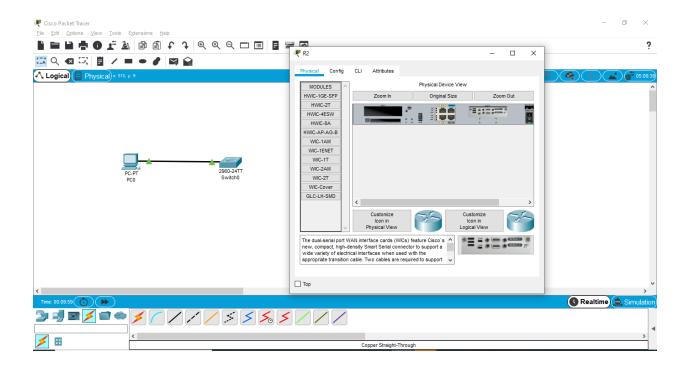

6. Assign the last valid host address in subnet 3 to PC2.

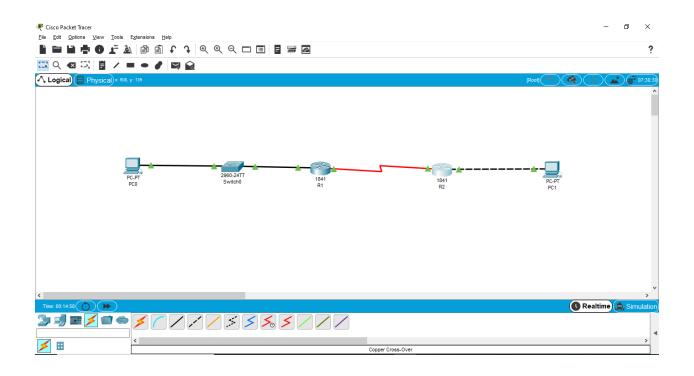

Step 2: Document the addresses to be used in the table provided under the Topology Diagram.

Task 3: Configure the Serial and FastEthernet Addresses.

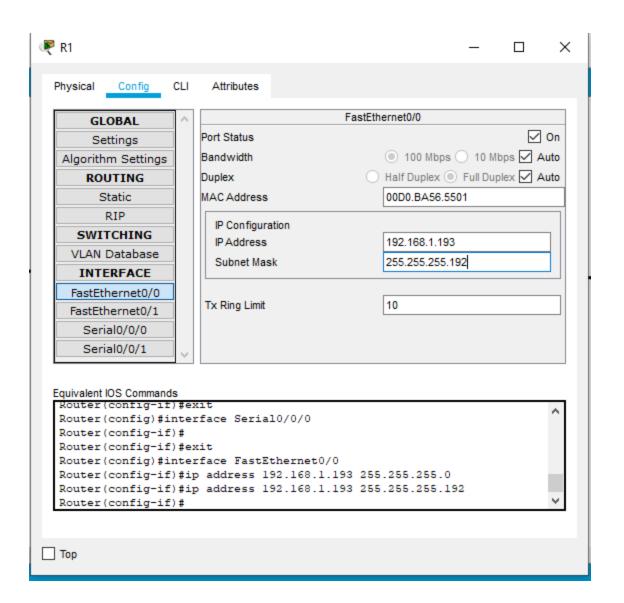

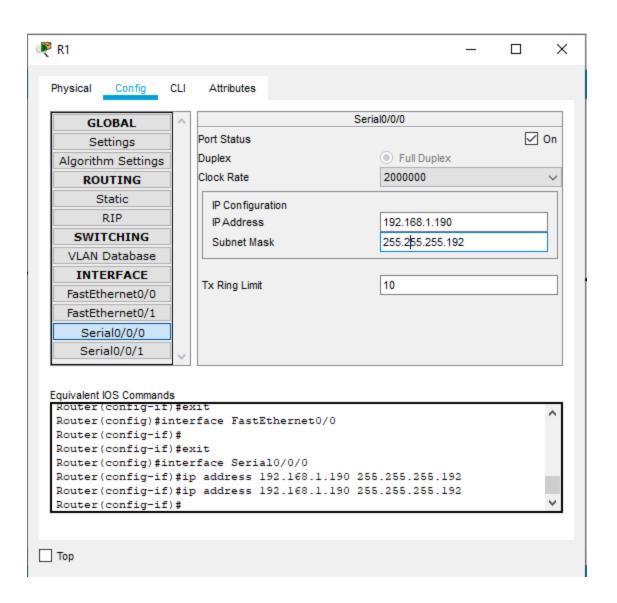

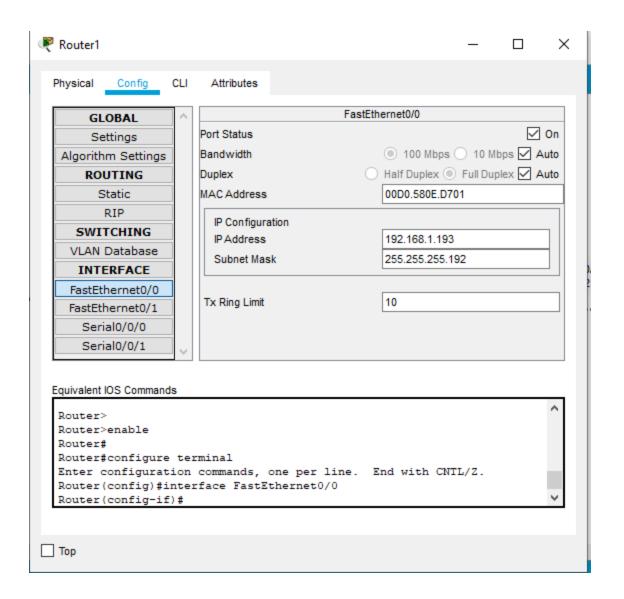

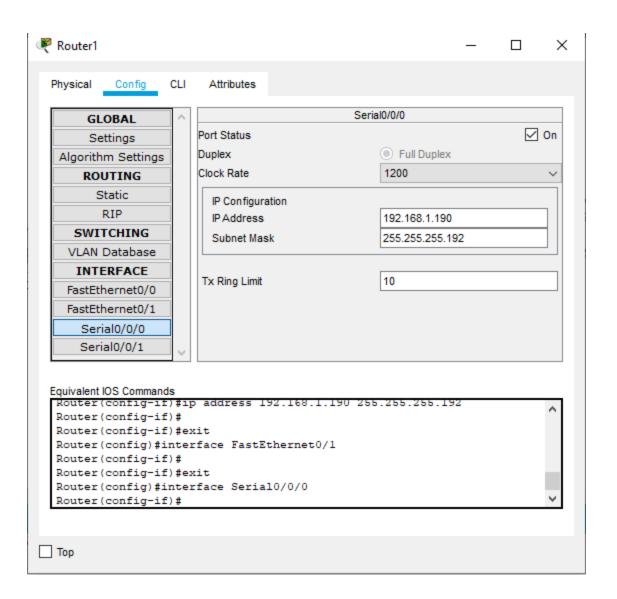

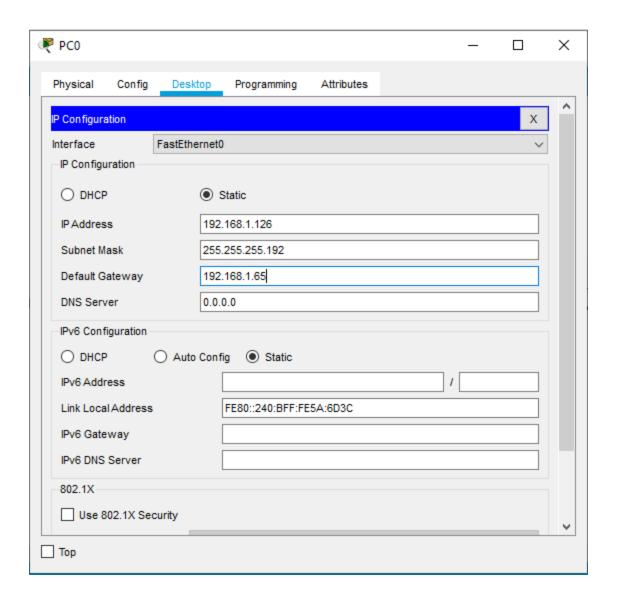

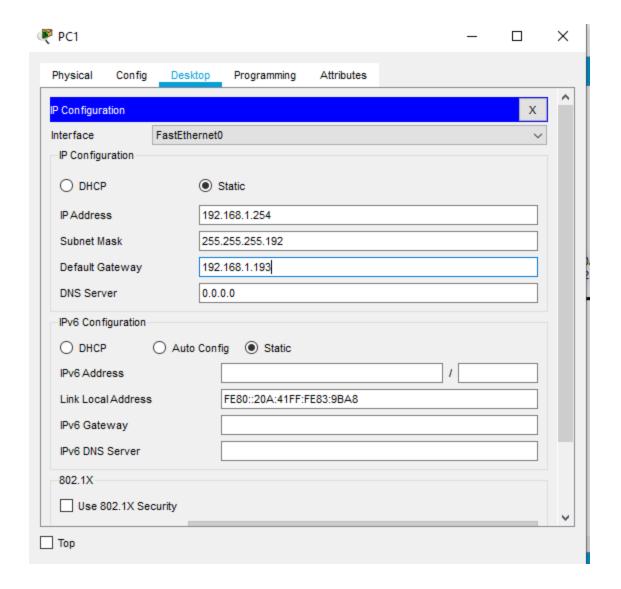

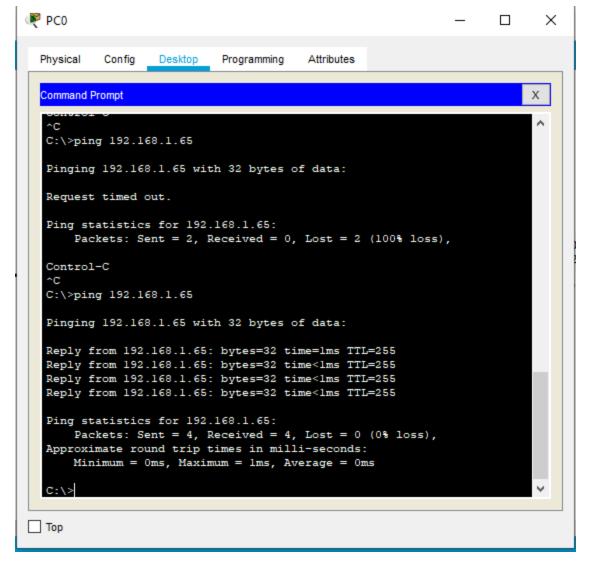

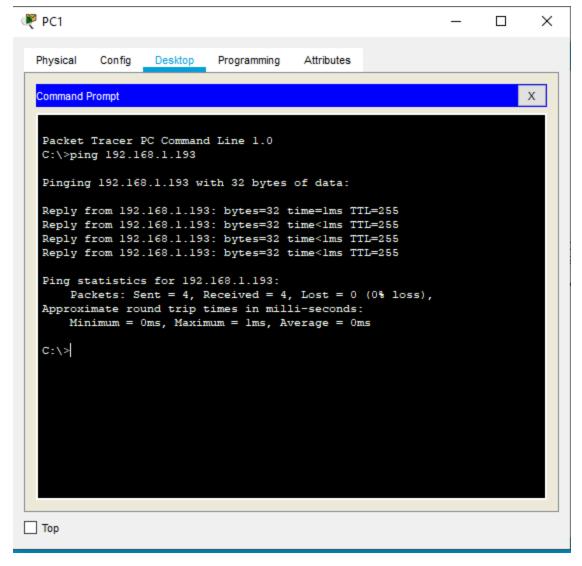

Task 4: Verify the Configurations.

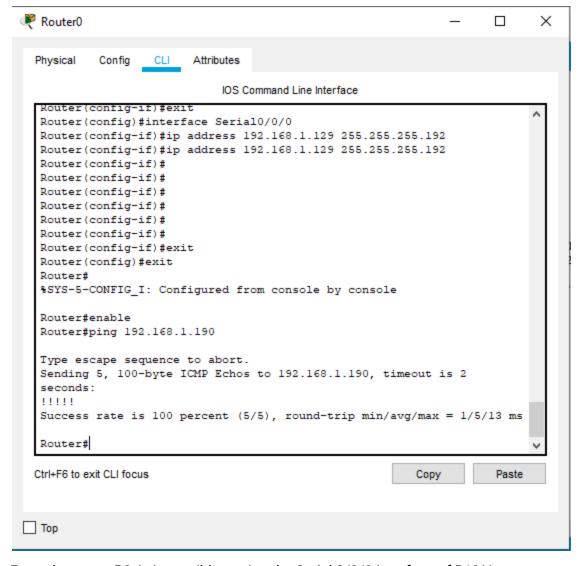

Answer the following questions to verify that the network is operating as expected. From the host attached to R1, is it possible to ping the default gateway?Yes

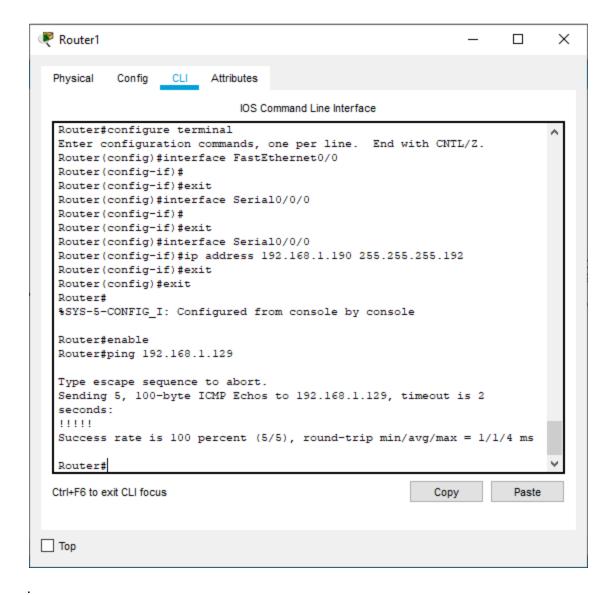

From the host attached to R2, is it possible to ping the default gateway? Yes

From the router R1, is it possible to ping the Serial 0/0/0 interface of R2?Yes

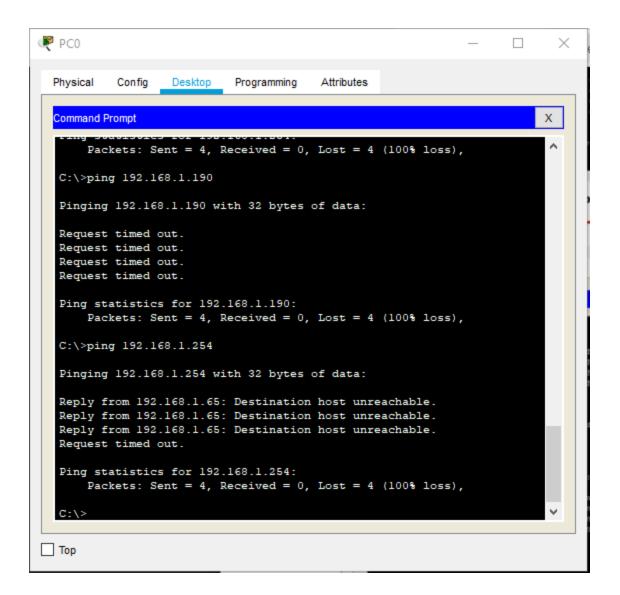

From the router R2, is it possible to ping the Serial 0/0/0 interface of R1? Yes

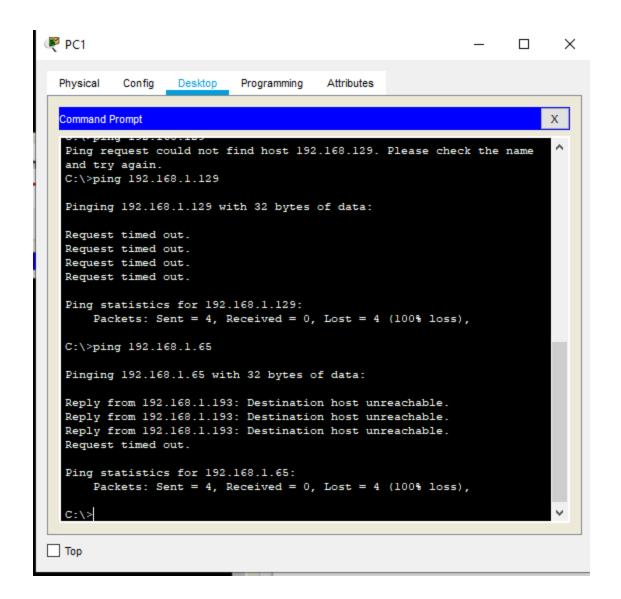

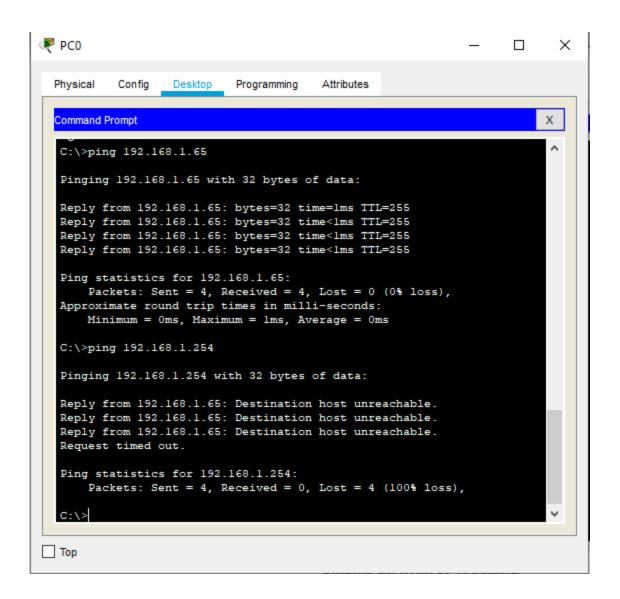

Task 5: Reflection

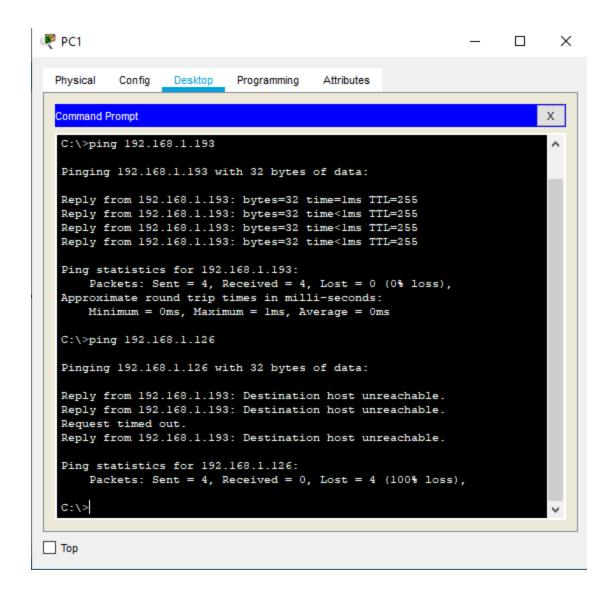

Are there any devices on the network that cannot ping each other?

Yes, devices that are not a part of the same network cannot ping each other. For example, PC1 and PC2 cannot ping each other

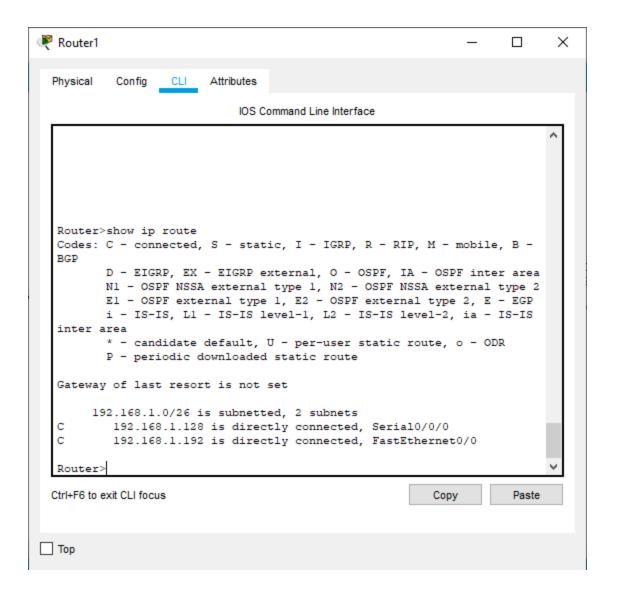

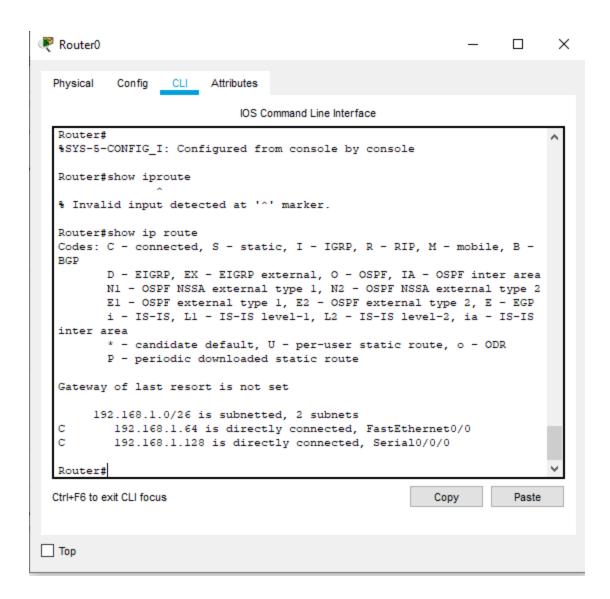

What is missing from the network that is preventing communication between these devices?

Switch is missing in communication between the two PC. Routers in our network only have address of devices which are directly connected to its interfaces in routing table. Hence static or dynamic routing is absent.

Conclusion: In this experiment I learnt about subnetting a given address space and assigning subnets to various networks accordingly. I also learnt about configuring serial port on router and established a connection between two routers using serial DTE.
